

# Why wait for the future.

## About Us

Quickstep Technologies Pty Ltd has been in development for 12 years. It is a disruptive technology because it changes the volume versus capital equation of traditional advanced composite manufacturing.

Quickstep manufactures process plants for supply under license to end customers. We also undertake paid development work for end-users and provide tooling and technical support services to a range of customers in the aerospace and automotive markets.

Our belief is that manufacturing cost is the largest impediment to the utilisation of advanced composite components, such as those reinforced with continuous glass, carbon or aramid fibres. Quickstep removes cost barriers, permitting the mass manufacture of advanced composites in lean cells. The result is significantly lower investment, tooling and energy costs, and in most cases a reduction in material and labour costs.

## Business Solutions

Since we have a breakthrough technology, we also have a breakthrough business plan.

Quickstep can become your technology partner to win contracts and maximize profit and product development.

Although we undertake part and process development under contract, our main business is the supply of highly automated Quickstep curing "cells" in sizes able to cure from one square metre to over twenty square metres in a single cycle, with larger custom solutions possible. Coincident with the supply of the machinery is a licence to utilise the patented Quickstep technology.

Contact us to discuss your specific opportunity.
